# think buyers

think, what it would be like, to see all supplier catalogues at work, as easily as online at home.

## Well with think you can.

think is an easy to use online buying platform, for any size organisation.
think provides access to supplier catalogues, using an easy and intuitive online experience, via any device.
like being at home and paying for goods online.
All this at a lower cost, to provide time and cost efficiencies,for your business.

## think how good that would be?

## BUYER ADVANTAGES
No licence or maintenance fees | Rapid search results under 1 second | Minimal deployment costs | Order consolidation | Payment risk reduction | Business process alignment | Compliance | Negligible training required | Data cleansing | Contracted price protection

"think ensures that searching on a broad range of catalogues, suppliers and service providers is extremely fast. Most searches are returned in less than 1 second and are relevant to the search terms used".

## EFFICIENCY
Simple accounts payable | Electronic purchase order delivery | Simple goods receipting | Financial approvals inbuilt | Buying policies embedded | Reduction of back office costs | 3 way auto matching | Business intelligence & analytics | Catalogue management | Multi tenant solution including end to end travel & expense

"think acknowledges that transactional suppliers as a group are integral for any organisation to function. However, the cost to manage and pay these suppliers is disproportional to the spend. In fact the cost to manage this spend can be as much as 80% of the accounts payable team, whilst the spend might be as little as 5% of the overall expenditure".

## PAYMENTS
Invoices matched automatically to purchase order & ERP | Payments generated automatically, including partial payment | Finance terms available to buyer on early payment to supplier | Improved cash flow management with finance terms | Reduce red tape | Remove duplicate payments | Consolidate orders & lower costs

"think's payment engine combined with think's procurement platform enables procurement and finance to understand exactly what the cash flow requirements of the business are at the present time. Finance has the power to override standard procurement policies in situations where spending needs to be controlled. Rather than stopping spending completely, think gives finance the ability to control spending where required by making their approval necessary on each transaction."
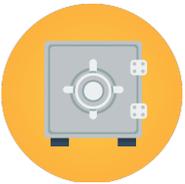

## MOBILITY
Cloud based - always available | Full  functionality on any device | Complete transactions on the go - can access from anywhere

"think recognises the needs of organisations that have BYOD strategies or a wide range of 'access' technologies as part of their SOE. think continues to be at the forefront of technology innovation. This innovation has enabled think's customers, both buyers and suppliers to access think from the widest possible platforms, both hardware and browser environments. This increases productivity and maximises the possibility for savings for our customers".
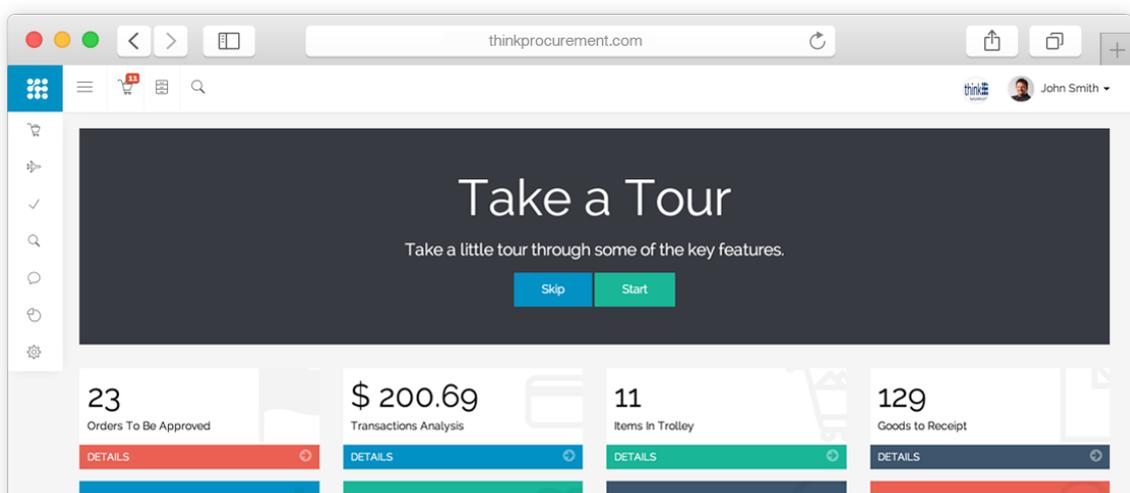

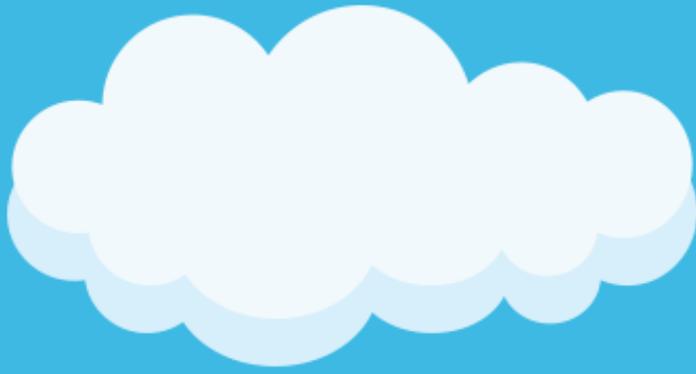

## SECURITY
PCI level 1 compliant | Total encryption of all security data | Data always available | Talks securely to your finance system | Secure user log in | Admin rights to configure your organisational users | Infrastructure security | Organisational security | Application security

"think invests heavily in security standards. think's security framework ensures the highest industry standards are met to manage the think infrastructure whilst implementing organisational policies, which exceed those of our customers because we go beyond those standards".

"Achieve best practice across all your procurement spend by deploying think".

The engine behind the world's best buying organisations.
